Python for Data Science Practical

Practical - IV

Roll No. :S046	Name:Abhishek Yadav
Class :BSC IT	Batch : 01
Date of Assignment :5/8/2026	Date/Time of Submission :5/8/2026

1. Creating a NumPy Array

A NumPy array is created using the array() function.

```
import numpy as np
a = np.array([1,2,3])

print(a)
```

[1 2 3]

2. Basic Array Operations

NumPy supports element-wise arithmetic operations such as addition, subtraction, multiplication, and division.

```
a = np.array([1,2,3])

print(a+10)
print(a*2)
```

[11 12 13]
[2 4 6]

▼ New Section

3. Array Slicing

Slicing is used to access a specific range of elements from an array.

```
a = np.array([1,2,3,4,5,6,7,8,9,10])
a[0:5]
```

array([1, 2, 3, 4, 5])

4. Sorting an Array

The sort() function arranges array elements in ascending or alphabetical order.

```
a = np.array(["Abhishek","Rohit","Sohan","Pro"])
print(np.sort(a))
```

['Abhishek' 'Pro' 'Rohit' 'Sohan']

5. Filtering an Array

Filtering returns elements that satisfy a given condition.

```
a = np.array([10,20,300,400])
a[a > 50]
```

array([300, 400])
